## Functions

Undervoltage monitoring (UNDER)
When the supply voltage $U$ is applied, the output relay $R$ switches into on-position, if the measured voltage is beyond the Min-value.
When the measured voltage falls below the Min-value, the output relay $R$ switches into off-position. The output relay $R$ switches into on-position again, if the voltage exceeds the Max-value.

## Window function (WIN)

When the supply voltage $U$ is applied, the output relay $R$ switches into on-position, if the measured voltage is within the adjusted window. When the measured voltage left the window between Min and Max, the output relay $R$ switches into off-position. The output relay $R$ switches into on-position again, if the voltage re-enter the adjusted window.
